

Jian Li

Problem 1

Formulate this problem to SAT,

First in this problem, we have to deal with four constraints below,

1. every task can only be done once,
2. an engineer can only do one task per week,
3. if one task is dependent on the other, the other one must be completed in earlier week than this one,
4. All tasks should be finished.

Assume X_{etw} represents *engineer e* finish the *tasks t* in *week w*, ($1 \leq e \leq E$, $1 \leq t \leq T$, $1 \leq w \leq W$)

A collection D keep track of all the dependencies among these tasks, if two tasks t_1, t_2 has a dependency relationship as t_1 depend on t_2 , we represent this as a pair (t_1, t_2) , D is a collection of all these pairs.

Thus,

For constraint 1,

For every task t in T , we need to consider all the combinations of engineers and weeks, make every two of them cannot be true at the same time. (I use pseudo code here to express my idea)

initial SAT exp

for every t_k in T :

for all pair $(e_i, w_m), (e_j, w_n)$ not same in E, W :

SAT and= $(\neg X_{e_i t_k w_m} \text{ or } \neg X_{e_j t_k w_n})$

For constraint 2,

For every engineer e in E , for every week w in W ,

we need to consider all the two size combinations of tasks, make every of them cannot be true at the same time.

take the SAT exp above

for every e_k in E:

for every w_n in W:

for all pair (t_i, t_j) , in T:

$$\text{SAT} \quad \text{and} = \quad (-X_{ekt_iw_n} \text{ or } -X_{ekt_jw_n})$$

For constraint 3,

For every dependency (n,m) in D, we need to make sure week of n and m, w_n and w_m has the relationship $w_n < w_m$.

take the SAT exp above

for every pair (n,m) in D:

for every w_n, w_m (where $w_n < w_m$) in W:

for all pair (e_i, e_j) , in E:

$$\text{SAT} \quad \text{and} = \quad (X_{einw_n} \text{ and } X_{ejmw_m})$$

For constraint 4,

we need to consider all the combinations of E,T and W.

for every e in E:

for every t in T:

for every w in W:

$$\text{SAT} \quad \text{and} = \quad X_{etw}$$

the final SAT is expression is the one that express this problem.

Problem 2

The answer is:

$(A \rightarrow B \vee Y_1) \wedge (\neg Y_1 \rightarrow G \vee H) \wedge (\neg B \rightarrow C \vee Y_2) \wedge (\neg Y_2 \rightarrow D \vee Y_3) \wedge (\neg Y_3 \rightarrow F \vee G) \wedge (A \rightarrow D \vee Y_4) \wedge (\neg Y_4 \rightarrow E \vee Y_5) \wedge (\neg Y_5 \rightarrow H \vee I) \wedge (F \rightarrow I \vee Y_6) \wedge (\neg Y_6 \rightarrow F \vee I)$

Problem 4

a.

This problem can be formulated as a SAT problem:

Assume we have n vertex(v_1, v_2, \dots, v_n) and m edges(e_1, e_2, \dots, e_m) in our graph, the available colors are c_1, c_2 , and c_3 .

For each vertex v_n , we assume three variable $v_n_{c1}, v_n_{c2}, v_n_{c3}$ to represent the color that this node is assigned.

1. For a vertex v_n , it must have only one kind of color, we express it in SAT as :

*(v_n_{c1} or v_n_{c2} or v_n_{c3}) and
 not (v_n_{c1} and v_n_{c2}) and
 not (v_n_{c1} and v_n_{c3}) and
 not (v_n_{c2} and v_n_{c3})*

this is equal to,

($v_n_{c1} \vee v_n_{c2} \vee v_n_{c3}$) and ($\neg v_n_{c1} \wedge \neg v_n_{c2}$) and ($\neg v_n_{c1} \wedge \neg v_n_{c3}$) and ($\neg v_n_{c2} \wedge \neg v_n_{c3}$)

2. For an edges e_m , the vertexes (v_i, v_j) that share this e_m cannot have the same color, we express the constraint as:

$\text{not } (v_{i_c1} \text{ and } v_{j_c1}) \text{ and}$

$\text{not } (v_{i_c2} \text{ and } v_{j_c2}) \text{ and}$

$\text{not } (v_{i_c3} \text{ and } v_{j_c3})$

this equals to,

$(\neg v_{i_c1} \neg v_{j_c1}) \text{ and } (\neg v_{i_c2} \neg v_{j_c2}) \text{ and } (\neg v_{i_c3} \neg v_{j_c3})$

After we get the first constraint of all vertexes and second of all edges together, we formulate this as a SAT problem.

b.

According to the solution above, we formulate this problem as a SAT expression below: (represent vertex 1 2 3 4 as A B C D for convenience)

$(A_{c1} A_{c2} A_{c3}) \text{ and } (B_{c1} B_{c2} B_{c3}) \text{ and } (C_{c1} C_{c2} C_{c3}) \text{ and } (D_{c1} D_{c2} D_{c3})$

$\text{and } (\neg A_{c1} \neg A_{c2}) \text{ and } (\neg A_{c1} \neg A_{c3}) \text{ and } (\neg A_{c2} \neg A_{c3})$

$\text{and } (\neg B_{c1} \neg B_{c2}) \text{ and } (\neg B_{c1} \neg B_{c3}) \text{ and } (\neg B_{c2} \neg B_{c3})$

$\text{and } (\neg C_{c1} \neg C_{c2}) \text{ and } (\neg C_{c1} \neg C_{c3}) \text{ and } (\neg C_{c2} \neg C_{c3})$

$\text{and } (\neg D_{c1} \neg D_{c2}) \text{ and } (\neg D_{c1} \neg D_{c3}) \text{ and } (\neg D_{c2} \neg D_{c3})$

$\text{and } (\neg A_{c1} \neg B_{c1}) \text{ and } (\neg A_{c2} \neg B_{c2}) \text{ and } (\neg A_{c3} \neg B_{c3})$

$\text{and } (\neg A_{c1} \neg C_{c1}) \text{ and } (\neg A_{c2} \neg C_{c2}) \text{ and } (\neg A_{c3} \neg C_{c3})$

$\text{and } (\neg B_{c1} \neg C_{c1}) \text{ and } (\neg B_{c2} \neg C_{c2}) \text{ and } (\neg B_{c3} \neg C_{c3})$

$\text{and } (\neg B_{c1} \neg D_{c1}) \text{ and } (\neg B_{c2} \neg D_{c2}) \text{ and } (\neg B_{c3} \neg D_{c3})$

$\text{and } (\neg C_{c1} \neg D_{c1}) \text{ and } (\neg C_{c2} \neg D_{c2}) \text{ and } (\neg C_{c3} \neg D_{c3})$

Solve it with DPLL:
